

What Is Claimed Is:

1. A method of reporting performance based data of selected elements, comprising the steps of:

submitting report options to a web server from a HTML form;

creating a database procedure call statement from the HTML form data;

sending the procedure call statement from the web server to a database server;

using parameters stored on the database server to query MetaData tables;

retrieving information from the queried tables;

returning the information to the database server;

using the returned information to create SQL statements;

executing the SQL statements against a server containing stored data and returning the results to the database server;

passing the results from the database server to the web server; and,

converting the results to a presentation form defined by the HTML form.

2. A system for reporting performance based data of selected elements, including:

a graphical user interface to prepare a HTML form;

a form handler in communication with said graphical user interface to convert said HTML form to a procedure call statement;

a means in communicating with said form handler for querying MetaData tables and for retrieving information from the queried tables and generating a SQL statement;

a means for executing said SQL statements against a server containing stored data and returning the results to the database server;

- a menu for passing the results from the database server to the web server;
- a means for converting the results to a presentation form defined by the HTML form; and
- a means for presentation of said results to the user.
